An Immersion Transducer is a type of ultrasonic transducer used in immersion testing, a non-destructive testing method. It consists of a piezoelectric crystal or a magnetic material that converts electrical energy into ultrasonic waves, and it is immersed in a liquid couplant to transmit and receive these waves. The transducer is designed with an acoustic impedance similar to the liquid couplant to maximize the transmission of ultrasonic waves into the test material and minimize reflections. Immersion transducers are commonly used for high-resolution ultrasonic inspections of materials such as metals, composites, and ceramics for flaw detection, thickness measurement, and material characterization.

The global Immersion Transducer market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
