The global Immersion Ultrasonic C-Scan System market size is predicted to grow from US\$ 651 million in 2025 to US\$ 921 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

In 2024, global immersion ultrasonic C-scan system production reached approximately 18100 units, with an average global market price of around K US\$ 35 per unit. The immersion ultrasonic C-scan system is an advanced non-destructive testing technology that is commonly used in the industrial field, especially in the aerospace, nuclear energy, oil and gas industries, to detect and evaluate defects or characteristics within materials. This system combines ultrasonic detection with C-scan imaging technology to provide high-resolution, high-contrast, two-dimensional or three-dimensional images.

The demand for immersion ultrasonic C-scan systems is growing rapidly with the tightening requirements of high-end manufacturing for internal defect detection. Its core driving force stems from the rigid demand for high-resolution, nondestructive and imageable quantitative analysis of internal defects in aerospace composite materials, new energy battery multilayer structures, semiconductor key components and other fields. This presents a clear opportunity, on the one hand, to replace traditional manual ultrasonic or low-end inspection methods with higher inspection accuracy, reliability and data traceability; on the other hand, more important opportunities lie in online inspection systems integrated with automated production lines and dedicated solutions for specific new materials (e.g. carbon fibers, ceramic matrix composites). For manufacturers who can overcome core technologies such as high-frequency ultrasonic transducers, precision scanning motion control and three-dimensional imaging algorithms, and provide stable and reliable integrated equipment, it is a key opportunity to break import dependence and establish advantages in this high-threshold market.

The annual production capacity of a single-line immersion ultrasound C-scan system is typically 2,000-3,000 units, with a gross profit margin of around 26%.

Downstream consumption of immersion ultrasound C-scan systems is distributed as follows: aerospace (26%), transportation (35%), metal processing (18%), and other sectors (21%).

Market Concentration and Key Players:

Internationally, the immersion ultrasonic C-scan system has a high degree of market concentration, mainly concentrated in developed countries such as Europe, America and Japan. Such as ScanMaster and TecScan and other large manufacturers; from the domestic point of view, the manufacturers of immersion ultrasonic C-scan system include Hangzhou Changchuan Technology and Hangzhou Acceleration Technology.

Manufacturing Processes and Market Trends:

The core technology of immersion ultrasonic C-scan system is to construct a high-precision acoustic scanning and imaging environment. The key is to precisely integrate the ultrasonic probe, the measured workpiece and the mechanical scanning mechanism into a stable water tank, and use water as a coupling medium to realize efficient transmission of acoustic waves. The core components of the system include a high-frequency ultrasonic transducer, a sophisticated multi-axis motion scanning system, and a high-performance data acquisition card. The manufacturing process focuses on the high positioning accuracy and motion stability control of the scanning mechanism to ensure that the sound beam can scan each position of the workpiece vertically and without vibration, and at the same time, it is necessary to solve the problems of constant temperature, degassing and anti-fouling of the aqueous medium to ensure the consistency of sound velocity. Signal processing and imaging software algorithms are another technical difficulty, responsible for reconstructing the collected RF signals into intuitive C-scan images and automatically identifying and quantifying defects.

In terms of market trends, the demand for this system is growing significantly with the improvement of internal defect nondestructive testing requirements in high-end manufacturing fields such as aerospace composite materials, new energy batteries and semiconductor packaging, and high resolution, quantification and full recording have become rigid requirements. Technology development focuses on higher scanning speed and imaging resolution, and electronic scanning is realized through phased array

technology to improve detection efficiency. At the same time, deep learning algorithms are being widely used in automatic identification and classification of defects, greatly improving analysis efficiency and accuracy. In addition, the system is deeply integrated with industrial robots and automated production lines, moving towards online full inspection, creating important opportunities for suppliers who can provide integrated intelligent inspection solutions.
