Immunomodulatory probiotics refer to a class of functional probiotics capable of helping to maintain immune balance by regulating the intestinal microecology and host immune responses. Rather than simply representing the concept of 'boosting immunity,' they more accurately function by improving the composition of the gut microbiota, strengthening the intestinal mucosal barrier, influencing immune cell activity, and modulating the secretion of inflammatory factors?thereby helping the body maintain a relatively stable state situated between 'insufficient defense' and 'excessive reaction.' Given that a significant portion of human immune activity is linked to the gut, these probiotics typically exert their primary effects within the intestinal tract before subsequently influencing systemic immune function. In 2025, the global production volume of immunomodulatory probiotics reached 675 tons, with an average price of \$120 per kilogram; leading companies in the industry reported gross margins ranging from approximately 45% to 55%.
