Immune checkpoint proteins are molecules found on the surface of immune cells, that play a crucial role in regulating the immune system. These proteins help maintain the balance between immune activation and immune tolerance, preventing the immune system from attacking normal cells and tissues in the body. However, their role can be subverted by cancer cells to evade immune detection. Targeting these proteins with immune checkpoint inhibitors has become a powerful strategy in cancer treatment, offering new hope for patients with various types of cancer.

The global Immune Checkpoint Proteins market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
