Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Immune Repertoire Sequencing market.

Immune Repertoire is the collection of B and T cells with functional diversity in the body that reflects the immune selectivity. Immune Repertoire Sequencing means to sequence the complimentary determining region of both B-cell receptor and T-cell receptor. Immune receptor repertoire profiling portrays as the antigen-specific information within lymphocytes and has become increasingly significant to understand body's autoimmunity and healthy immunity. This also propose novel ways to tackle cancer and development of personalized medicine by understanding the genetic makeup of a person. Since the last two decades, the technical advancements in the high throughput sequencing techniques along with the development in the bioinformatics and statistical tools have made the immune repertoire sequencing to be analyzed at single sequence level. This technology has potential to explore for the novel infectious agents and also

offers new approaches for vaccine or antibody development.
