Immunoabsorption (IA) therapy refers to the use of antigen-antibody immune reaction to remove pathogenic factors in plasma or the use of absorbent materials to remove immune-related pathogenic factors in plasma through extracorporeal circulation to achieve the purpose of treating diseases. Immunoabsorption therapy is a new technology developed on the basis of plasma exchange. It is an important part of blood purification. Immunoabsorption Columns is the core equipment of this therapy, which is responsible for adsorbing pathogenic factors. The core part of the adsorption reaction

with the adsorption target (pathogenic substance) is called the carrier, and the substance that is fixed on the carrier and has immunoabsorption activity is called the ligand, and the two interact through cross-linking or coupling
