Immunoglobulin G Separation Reagents refer to functional separation materials and associated reagent formats designed for the selective capture, enrichment, elution, and purification of immunoglobulin G, monoclonal antibodies, polyclonal antibodies, Fc-fusion proteins, and related antibody-derived molecules. These products are typically based on immobilized Protein A, Protein G, Protein A/G, Protein L, anti-IgG ligands, or Fc-specific binding ligands that are covalently coupled, directionally immobilized, magnetically incorporated, membrane-fixed, or surface-functionalized onto agarose, modified agarose, methacrylate, cellulose, magnetic particles, polymer microspheres, membrane substrates, or composite matrices. Major product forms include process-scale affinity chromatography resins, laboratory agarose beads, magnetic beads, prepacked columns, spin columns, filter plates, membrane adsorbers, and antibody purification kits. Key performance parameters generally include dynamic binding capacity, ligand leakage, alkaline cleaning tolerance, flow-pressure behavior, nonspecific binding, elution conditions, sample compatibility, and lot-to-lot consistency.
