The global Immunopeptidome Profiling market size is predicted to grow from US\$ 415 million in 2025 to US\$ 743 million in 2032; it is expected to grow at a CAGR of 8.8% from 2026 to 2032.

The immunopeptidome refers to the study of all peptides presented by nucleated cells on MHC-Class I or II proteins (Major Histocompatibility Complex, also known as the major histocompatibility complex, such as the expression product of human MHC, HLA, Human Leukocyte Antigen) involved in the antigen presentation pathway, and is essential for the investigation of immunogenic epitopes in cell-mediated and humoral responses. Immunopeptidome profiling is the study of the dynamics and composition of class I and II immune peptides, enabling not only the discovery of targets for personalized cancer immunotherapy (such as neoantigens from tumor-specific mutations or tumor-associated antigens), but also contributes to new mRNA/polypeptide vaccines and immune cell therapy.
