The global IMP4279 market size is predicted to grow from US\$ 2.93 million in 2025 to US\$ 49.85 million in 2032; it is expected to grow at a CAGR of 9.2% from 2026 to 2032.

IMP4279 is a novel DNA damage response pathway inhibitor independently developed by Impact Therapeutics at the preclinical research stage, focusing on exploring unmet clinical needs in the field of oncology. Designed and optimized based on the company's technological expertise in DDR inhibitor platforms, this compound exhibits high target selectivity and favorable druggability. It aims to inhibit tumor cell proliferation and enhance the sensitivity of other antineoplastic therapies by interfering with the DNA repair mechanism of tumor cells. As an investigational innovative small-molecule drug, IMP4279 has not yet entered clinical trials, and its mechanism of action, safety profile, and efficacy are still being continuously verified in preclinical models. In the future, it is expected to be used as a single agent or in combination with chemotherapy, targeted therapy, and immunotherapy for the treatment of various solid tumors, providing new potential therapeutic options for patients with malignant tumors. In 2025, global IMP4279 production reached approximately 2,000 vials.

As a novel preclinical DDR pathway inhibitor, IMP4279 operates within a rapidly expanding global oncology market driven by unmet medical needs and the growing adoption of targeted therapies. The broader DNA damage repair (DDR) inhibitor sector, underpinned by the synthetic lethality mechanism, has gained significant traction, establishing itself as a high-growth and strategically vital segment within precision oncology. This market landscape is characterized by a robust pipeline of innovative agents, a shift towards novel targets beyond established PARP inhibitors, and an increasing emphasis on combination regimens to overcome treatment resistance and enhance efficacy. Positioned at the forefront of this trend, IMP4279 benefits from the favorable industry dynamics and the proven commercial success of earlier DDR drugs. Its clinical-stage potential is underscored by the strong market demand for next-

generation treatments that offer improved selectivity, safety profiles, and the ability to synergize with existing chemo-, targeted, and immunotherapies. Despite being in the preclinical phase, IMP4279 holds considerable market promise, targeting a broad spectrum of solid tumors where current standards of care are limited. Its development aligns with the global pharmaceutical industry's strategic focus on first-in-class and best-in-class molecules, which command premium pricing and significant market penetration upon successful launch. While competitive pressures are intensifying as more players enter the DDR space, IMP4279's distinct mechanism of action and early-stage positioning provide a valuable opportunity to capture future market share. Successful clinical advancement would allow IMP4279 to address the persistent gaps in cancer care, solidifying its role as a key component in the next wave of transformative oncological therapies and securing a strong commercial foothold in the expanding global DDR inhibitor market.
