The Impedance Tube Apparatus, also known as the Kundt’s Tube or Acoustic Impedance Tube, is a device used to measure the sound absorption coefficient and acoustic impedance of materials. It typically consists of a cylindrical tube with a sound source at one end and microphones placed along the tube to capture sound wave propagation. By analyzing the interference patterns and pressure variations, the apparatus determines the material's ability to absorb or reflect sound waves. It is widely used in acoustics research, material testing, and noise control applications.

United States market for Impedance Tube Apparatus is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
