Implantable Glucose Monitors are a type of Continuous Glucose Monitoring (CGM) device in which a sensor is implanted subcutaneously through a minimally invasive procedure. These devices continuously measure glucose levels in the body and transmit data wirelessly to a receiver or smartphone app. Compared to conventional skin patch-type CGM systems, implantable monitors offer a longer lifespan and reduced replacement frequency, making them suitable for long-term diabetes management.In 2024, global production of implantable glucose monitors reached approximately 220,000 units, with an average market price of around US$2,800 per unit (including the implantable sensor and companion receiver). The global production capacity was about 250,000 units, with a utilization rate of around 90%. As a high-end medical device, the gross margin remains relatively high at 55%–60%.Upstream: biosensor materials, microchips, implant-grade packaging materials.Midstream: implantable glucose monitor manufacturers and developers.Downstream: hospitals, diabetes clinics, medical device distributors, patient groups.
