Implantable Polyethylene Glycol (PEG) material is a biocompatible and versatile polymer used in medical applications, particularly for its non-toxic and hydrophilic properties. PEG is often employed in drug delivery systems, tissue engineering, and as a coating for medical devices to improve biocompatibility and reduce immune responses. Its hydrophilicity allows it to resist protein adsorption and cell adhesion, making it ideal for creating stealth surfaces in implants. Additionally, PEG can be chemically modified to enhance its functionality, such as by attaching therapeutic agents or targeting ligands, allowing for controlled drug release and improved therapeutic outcomes. Its biodegradability and ability to form hydrogels make it useful in a range of implantable applications.

The global Implantable Polyethylene Glycol (PEG) Material market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
