The global Improved Flexion Tyre (IF Tyre) market size is predicted to grow from US\$ 5478 million in 2025 to US\$ 7754 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

Improved flexion tyre is a modern radial tyre that, through optimized carcass structure and materials, can safely withstand the same load at approximately 20% lower operating pressure than standard tires of the same size, or increase load capacity by approximately 20% at the same pressure. The demand for improved flexural tires stems from the need across industries for an early and economical solution to the common contradiction between 'heavy equipment' and 'ground protection': upstream agricultural machinery, construction machinery, and special vehicle manufacturers need a technology that effectively reduces the stress of equipment on the ground (soil, hardened surfaces, sensitive sites) to enhance product competitiveness and environmental image; while downstream farmers, logistics companies, and facility managers urgently need to control costs while reducing operational damage to ground assets and maintenance costs. The upstream supply chain relies on a mature radial tire manufacturing system, primarily using upgraded steel cord, conventional synthetic rubber, and standardized carcass materials; downstream applications are widespread in the OEM and replacement markets for equipment such as tractors, telescopic forklifts, and airport trailers, and a broad dealer network serves cost-sensitive users. By 2025, the production of improved flexion tyre will reach approximately 7 million units, with an average selling price of approximately US\$800 per tire, a gross profit margin of approximately 30%, and a single production line capacity of approximately 80,000 units per year.
