The global Impurity Identification and Characterization market size is predicted to grow from US\$ 870 million in 2025 to US\$ 1299 million in 2032; it is expected to grow at a CAGR of 5.9% from 2026 to 2032.

To address the challenges inherent in traditional impurity detection—specifically vague qualitative results, significant quantitative errors, and a reliance on empirical trial-and-error for process optimization—impurity identification and characterization technologies have emerged. Since the breakthrough in coupled chromatography-mass spectrometry techniques in the 1970s, this field has evolved through the integration of separation science, spectroscopic analysis, and data modeling. It has gradually developed into a systematic analytical platform encompassing structural elucidation, content determination, source tracing, and risk assessment. This technology is now widely applied across various sectors, including the pharmaceutical industry, semiconductor manufacturing, environmental monitoring, and food safety.

Impurity identification and characterization serve as the cornerstone of pharmaceutical quality control. Driven by the dual forces of technological innovation and market demand, the industry is currently upgrading from a model of “passive detection” to one of “proactive prediction and prevention.” Enterprises possessing proprietary databases, AI algorithms, and cross-disciplinary integration capabilities are poised to lead this transformation, while those lacking fundamental technological innovation face the risk of obsolescence.
