In-Can Preservatives are substances that prevent the paint inside the can from spoiling. Any paint stored in a container is considered in-can paint. To ensure the performance and durability of paints and coatings, they need to be protected from antimicrobial activities such as yeasts, bacteria and fungi. Microorganisms can contaminate a product at any point during production, transport and use, allowing the organism to multiply from that point on. Because coatings provide ideal conditions for microbial growth, an effective solution must actively protect the coating from the inside, rather than treating the contaminants on the surface.
