The global In Situ Atomic Force Microscope market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An in situ atomic force microscope is a scientific instrument capable of imaging at atomic resolution while the sample is in its natural environment or reaction conditions. It employs a sharp probe that interacts with the sample surface, measuring the forces between the probe and the sample to obtain surface topography information. This instrument is widely used in fields like materials science, biology, and chemistry, providing researchers with valuable in situ observation and analysis tools.

The in situ atomic force microscope industry is exhibiting a positive development trend. Upstream, the continuous innovation of probe manufacturing technology has led to improved instrument resolution and sensitivity. Downstream application fields, such as nanomaterials, biomedical, and catalysis, are increasingly demanding in situ observation and analysis, promoting the expansion of the instrument market. In terms of product specifications, instrument functions are continuously enriched, enabling more complex environmental control and more precise measurements. The future market size is expected to continue growing, meeting the increasing research and industrial needs.
