## Abstracts

The global In-Situ Continuous Emissions Monitoring Systems market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The in-situ continuous emission monitoring system (CEMS) can directly measure pollutants within chimneys, providing real-time measurement results without the need for a gas sample management system. This system typically consists of an analyzer and a control unit, with a dedicated probe inserted into the chimney or pipeline where gases flow, allowing for timely measurement of gas concentrations within the internal space. The significant advantages of this method lie in its short response time, enabling rapid and accurate measurements. Additionally, it is relatively easy to install and operate, requiring no additional pretreatment processes. Its practicality reduces maintenance and operational costs.
