The in-situ electron microscope measurement system is a high-precision device that combines electron microscope technology with real-time sample monitoring functions. It is used to capture the physical and chemical changes of samples in real time during microscopic observation or experiments. Through in-situ electron microscopy, researchers can directly observe the changes of samples in natural environments or under specific conditions (such as high temperature, humidity, electric field, magnetic field, etc.) under scanning electron microscopes (SEM) or transmission electron microscopes (TEM). It is used in the fields of materials science, biology, nanotechnology, etc. to analyze the behavior of materials during actual use or under experimental conditions, providing higher dynamic and spatial resolution than traditional electron microscopes.

United States market for In-Situ Electron Microscope Measurement System is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
