In Situ Hybridization (ISH)

In Situ Hybridization (ISH) is a technique that allows for precise localization of a specific segment of nucleic acid within a histologic section.

The underlying basis of ISH is that nucleic acids, if preserved adequately within a histologic specimen, can be detected through the application of a complementary strand of nucleic acid to which a reporter molecule is attached.

Visualization of the reporter molecule allows to localize DNA or RNA sequences in a heterogeneous cell populations including tissue samples and environmental samples. Riboprobes also allow to localize and assess degree of gene expression. The technique is particularly useful in neuroscience.

Over the next five years, LPI(LP Information) projects that In-Situ Hybridization will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global In-Situ Hybridization market for 2018-2023.
