The global In Situ Hydrogel market size is predicted to grow from US\$ 885 million in 2025 to US\$ 1242 million in 2032; it is expected to grow at a CAGR of 5.0% from 2026 to 2032.

An In Situ Hydrogel is a functional material that remains in a liquid, sol, or flowable state before administration and forms a three-dimensional gel network at the target site after injection, spraying, or local application. Gelation can be triggered through chemical crosslinking, temperature response, ionic interaction, pH change, light exposure, enzymatic reaction, or other mechanisms. As In Situ Hydrogels can conform to irregular tissue surfaces or fill tissue spaces while forming a stable and absorbable local barrier, they are increasingly used in surgical sealing, leakage prevention, postoperative adhesion prevention, tissue spacing for radiation therapy, localized drug delivery, and tissue repair. Based on an estimated market scope covering finished medical products, mainstream In Situ Hydrogel products are typically priced at approximately USD 300-1,500 per kit, while premium products such as hydrogel spacers for radiation therapy can reach USD 2,000-3,000 per kit, with global annual sales estimated at around 1.0-2.0 million kits.

The upstream supply chain of In Situ Hydrogels mainly includes polyethylene glycol, poly lactic-co-glycolic acid, polylactic acid, poloxamers, hyaluronic acid, chitosan, gelatin, and other natural or synthetic polymer materials, as well as crosslinking agents, pharmaceutical excipients, active ingredients, syringes, catheters, mixing devices, and spraying systems. Midstream manufacturers are responsible for formulation design, gelation mechanism development, delivery-system integration, sterilization and packaging, quality control, clinical validation, and regulatory registration. Depending on the intended medical use, these companies may provide injectable, sprayable, or locally applied products. Downstream users primarily include hospitals and other healthcare institutions, with applications in neurosurgery, cardiothoracic surgery, vascular surgery,

general surgery, gynecology, urology, radiation oncology, and regenerative medicine.

The In Situ Hydrogel market is gradually evolving from basic material research toward the commercialization of clinically oriented products. Surgical sealing and leakage prevention, postoperative adhesion prevention, and tissue spacing for radiation therapy have already established relatively clear commercialization pathways. Product safety, gelation speed, tissue conformability, absorption period, and ease of clinical use are major factors shaping market competitiveness. As demand for minimally invasive surgery, precision radiation therapy, and localized treatment continues to expand, In Situ Hydrogels are expected to gain broader applications in controlled drug release, hemostasis, wound repair, tissue regeneration, and specialty care. For manufacturers, competitive strength depends not only on material innovation but also on delivery-device design, clinical evidence, regulatory capabilities, and hospital channel development.
