Abstracts

The global In-Vehicle Video Surveillance System market size is predicted to grow from US$ 15511 million in 2025 to US$ 27355 million in 2032; it is expected to grow at a CAGR of 8.9% from 2026 to 2032.

In-Vehicle Video Surveillance System is a video surveillance solution specifically designed for mobile vehicle environments. By integrating audio and video encoding/decoding technologies, wireless network communication technologies, global positioning systems (GPS), and GIS geographic information technologies, it enables real-time acquisition, storage, transmission, and analysis of information regarding the vehicle's internal and external environments and its operational status during driving and operation. The system typically consists of a three-tier architecture: an in-vehicle terminal, a wireless transmission network, and a central management platform. The in-vehicle terminal (i.e., an in-vehicle DVR or MDVR) serves as the core hardware, integrating GPS satellite positioning and 4G/5G wireless network transmission capabilities in addition to traditional recording functions. The wireless transmission network is responsible for transmitting the acquired audio and video data back in real time. The central management platform enables centralized monitoring, dispatching, and command of all connected vehicles.

In-Vehicle Video Surveillance System not only provides real-time wireless transmission of vehicle routes, in-vehicle and external video images, but also offers comprehensive management functions such as vehicle anti-theft, anti-hijacking, rapid accident response, and call command. The system has been widely used in various scenarios, including buses, long-distance coaches, school buses, taxis, logistics vehicles, police vehicles, escort vehicles, and rail transit.
