The global In vitro Glyco Engineering (IVGE) market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

In vitro Glyco Engineering (IVGE) Service is a service offered by biotechnology companies or research institutions that involves the modification of glycoproteins in a laboratory setting. Glycoproteins are proteins that have sugar molecules attached to them, and they play important roles in various biological processes.

IVGE service allows researchers to modify the glycosylation patterns of glycoproteins in a controlled environment, without the need for complex genetic engineering techniques. This service can be used to study the effects of specific glycosylation patterns on the function and properties of glycoproteins.

IVGE service typically involves the use of enzymes or other glycosylation-modifying agents to selectively add, remove, or modify sugar molecules on glycoproteins. The modified glycoproteins can then be analyzed and characterized using various techniques, such as mass spectrometry or chromatography.

IVGE service can be used in various applications, including drug development, biomanufacturing, and basic research. By modifying the glycosylation patterns of glycoproteins, researchers can potentially improve the therapeutic efficacy, stability, or immunogenicity of drugs, or enhance the production and quality of biopharmaceuticals.

United States market for In vitro Glyco Engineering (IVGE) is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
