In Vitro Skin Permeation Testing is a laboratory method used to measure the rate and extent to which a substance penetrates the skin when applied topically. This test typically involves applying a formulation to a skin sample (either human or animal-derived, or synthetic) and measuring the amount of the active ingredient that permeates the skin over a set period. The collected data helps in evaluating the effectiveness of drug delivery systems, understanding the potential for systemic absorption, and ensuring the safety and efficacy of topical or transdermal products. IVSPT is commonly used in the development of skin-based therapies and for regulatory purposes.
