According to our LPI (LP Information) latest study, the global In-wheel Motors market size was valued at US\$ 38 million in 2023. With growing demand in downstream market, the In-wheel Motors is forecast to a readjusted size of US\$ 288.4 million by 2030 with a CAGR of 33.5% during review period.

The research report highlights the growth potential of the global In-wheel Motors market. In-wheel Motors are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of In-wheel Motors. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the In-wheel Motors market.

In-wheel motors allow torque to be applied at the wheel; the point where the torque is required. In-wheel motors occupy the most unobtrusive space inside the vehicle, leaving more volume inside the vehicle body for batteries and luggage.

Direct-drive, in-wheel motors require no gearboxes, driveshafts or differentials, thus giving far greater flexibility to vehicle designers while substantially reducing drivetrain losses. The reduced drivetrain losses mean less energy is wasted (during both acceleration and regenerative braking), resulting in more of the energy from the battery pack being available to propel the vehicle.

Each in-wheel motor can be controlled entirely independently, providing far greater control, performance and vehicle dynamics characteristics than any other drive system; traction control, launch control and torque vectoring are all easily implemented through

the use of in-wheel motors.

Global In-wheel Motors main players are DSM, CSPC Pharma, Shandong Luwei, Northeast Pharma, etc. Global top four manufacturers hold a share over 80%. China is the largest market, with a share nearly 60%.
