Polio vaccines can be classified into two types: the inactivated polio vaccine (IPV) and oral polio vaccine. Oral polio vaccine is more active than IPV as it has both weakened and live poliovirus. Inactivated polio vaccine is a vaccine prepared from suspension of inactivated (killed) poliovirus strains with formalin. It is an injectable vaccine that can either be given alone or with other vaccines. IPV has the ability to provide serum immunity against all the three types of poliovirus and consequent protection against paralytic poliomyelitis. Rabies virus is transferred to humans through the saliva of an animal who is infected by it. Inactivated rabies virus (IRV) is injected before or after the infection of the virus in 1 ml doses having 2.5 IU per ml of rabies virus antigen.
