An inboard propeller shaft is a transmission shaft used in a ship's power system. It propels the ship forward by transferring power from the ship's main engine to the propeller inside the hull. An inboard propeller shaft is usually installed inside the hull, connected to the main engine, and supported and protected by bearings, seals, and a transmission system. This design is often used on large ships. Since the propeller is located at the stern, the shaft's transmission method is more stable and can withstand higher loads and greater propulsion. An inboard propeller shaft provides higher propulsion efficiency, reduces exposure to external equipment, and helps improve the ship's power transmission efficiency and navigation stability.
