Indexing conveyor chain, also known as indexing chain, is a type of conveyor chain that is designed to accurately position and move products or materials at specific intervals along a conveyor system. It is commonly used in automated manufacturing and assembly processes, where precise control and positioning of products or materials is critical.

Conveyor chains are essential components used in various industries for material handling, manufacturing processes, and logistics. The global market for conveyor chains is subject to several trends and developments. The trend toward automation and the adoption of Industry 4.0 principles have driven the demand for conveyor chains in manufacturing and logistics. Conveyor systems play a crucial role in creating efficient and flexible production lines. The growth of e-commerce and the need for efficient warehousing and distribution have led to increased demand for conveyor chains in sorting centers, fulfillment centers, and distribution hubs. Sustainability initiatives and the focus on reducing energy consumption have driven the development of energy-efficient conveyor chains. These chains are designed to minimize friction and optimize energy usage. Conveyor systems with modular and flexible designs have become popular. These systems allow for quick reconfiguration and adaptation to changing production or logistics needs.
