Indium is a heavy metal element commonly used in target preparation, especially in fields such as nuclear medicine and X-ray diffraction. Indium targets generally have high density and good absorption properties, making them excellent in the absorption of X-rays and gamma rays. This makes indium targets an important material for the production of medical radioisotopes, X-ray tubes, and for materials analysis and structural characterization. Indium targets are usually prepared in the form of high-purity indium metal or indium compounds, and then processed into targets of the desired shape and size by pressing, hot pressing or other processes. These indium targets provide stable radiation characteristics and are resistant to radiation damage to a certain extent, making them widely used in various nuclear medicine and X-ray applications.

The global Indium For Targets market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
