The global Indium Antimonide Detector Alarm market size is predicted to grow from US\$ 773 million in 2025 to US\$ 1547 million in 2032; it is expected to grow at a CAGR of 10.5% from 2026 to 2032.

Indium antimonide (InSb) detector alarms are monitoring and alarm devices based on the infrared detection characteristics of the InSb semiconductor material. They utilize the high-sensitivity photoelectric response of InSb in the mid-infrared band (typically 3-5 μ m) to convert infrared radiation signals into electrical signals, triggering an alarm or control output when the target radiation intensity exceeds a set threshold. These systems typically require cooling components (such as Stirling refrigerators) to reduce thermal noise, thereby improving detection accuracy and signal-to-noise ratio. They are widely used in fields requiring high-sensitivity infrared monitoring, such as military early warning, gas leak monitoring, industrial high-temperature detection, and aerospace infrared detection.

The indium antimonide (InSb) detector alarm industry chain consists of upstream core materials and devices (including high-purity InSb crystal materials, epitaxial growth wafers, infrared optical lenses and filters, Stirling refrigerators, and low-noise front-end readout circuits (ROICs), etc.), midstream detector and alarm system manufacturers (responsible for InSb infrared detector chip packaging, cooled detection module design, signal processing algorithm development, and overall alarm system integration), and downstream application industries (defense and military infrared early warning, industrial gas leak monitoring, high-temperature industrial furnace monitoring, aerospace remote sensing, and special safety detection, etc.). The upstream high-purity materials and refrigerator core components have extremely high technological barriers, with gross profit margins typically ranging from 40% to 60%. The midstream detector

and system integration segments, involving high-end optoelectronic packaging and precision cooling control, generally have gross profit margins of 50% to 75%, while the downstream system integration and application service segments have gross profit margins of approximately 30% to 50%. The overall industry exhibits a high-tech, high-barrier structure characterized by high-end materials and cooling core driving force + midstream high-value-added system integration + downstream military and industrial application support.

In 2025, the average price of indium antimonide detector alarm was US\$50 k per unit, with sales of 15.8 k units and a total production capacity of 23 k units.

Indium antimonide (InSb) detector alarms represent a typical application of mid-wave infrared (MWIR) high-sensitivity detection technology in high-end early warning and industrial monitoring. Their core advantage lies in the high quantum efficiency and rapid response capability of InSb material, enabling precise capture of weak infrared radiation in the 3-5 μ m band. Therefore, they are irreplaceable in high-temperature target identification, gas leak detection, and military infrared alarms. However, this technology also has significant limitations. For example, it relies on cryogenic systems such as Stirling cooling to reduce thermal noise, resulting in higher size, power consumption, and maintenance costs, limiting its widespread adoption in low-cost or large-scale civilian applications. With the performance improvement of uncooled infrared detectors (such as VOx and a-Si) and the development of new technologies such as quantum well infrared detectors (QWIP), the InSb system faces some replacement pressure. However, it will continue to occupy a key position in high-end military and high-precision industrial detection fields, evolving towards miniaturization, low power consumption, and system integration.
