The indium antimonide Hall element is a component that uses the Hall effect to detect or control magnetic fields. It is made of indium antimonide material.

The indium antimonide Hall element mainly consists of an indium antimonide thin sheet and three electrodes, two of which are used to provide current and the third electrode is used to measure the Hall voltage. When an external magnetic field is applied, the carriers in the indium antimonide flake are affected by the Lorentz force and produce lateral displacement, resulting in the generation of a lateral electric field, which is the Hall potential. Indium antimonide Hall elements have the characteristics of high sensitivity, high stability, high temperature stability, and wide application.
