The global Indium Solder Preforms market size is predicted to grow from US\$ 1157 million in 2025 to US\$ 1558 million in 2031; it is expected to grow at a CAGR of 5.1% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Indium solder preforms are precision-engineered, pre-shaped pieces of solder made primarily from indium or indium-based alloys. These preforms are typically produced in standard shapes such as washers, rectangles, squares, or custom geometries to meet the requirements of specific bonding applications. Indium solder preforms are valued for their low melting points, excellent wetting properties, and high ductility, making them ideal for delicate or heat-sensitive components. They are commonly used in microelectronics, optoelectronics, thermal management interfaces, and hermetic sealing due to their ability to form strong, reliable, and void-free solder joints at low processing temperatures.

Indium solder preforms are available in various alloy compositions such as pure indium (99.99%), InSn50, InBi58, and InAg3.5, with melting points ranging from approximately 72 °C (InBi58) to 157 °C (pure indium), making them ideal for low-temperature applications. Typical product dimensions range from 25 to 250 µm in thickness, with customizable shapes like rectangles, washers, and discs. They offer high thermal conductivity (up to ~86 W/m·K for pure indium), excellent electrical conductivity (~11.7 ? 10⁷ S/m), and strong wettability on metals like gold, copper, and nickel. These properties make indium preforms suitable for demanding uses in optoelectronics,

semiconductors, aerospace, and thermal management systems.
