The dust sensor can be used for continuous monitoring of total dust concentration. The working principle of the dust sensor is developed according to the scattering principle of light. Particles and molecules can produce light scattering phenomenon under the irradiation of light. On the other hand, they can also absorb part of the energy of the irradiation light. When a parallel monochromatic light is incident on the measured particle field, it will suffer from the interference of scattering and absorption around the particle, and the light intensity will be attenuated. In this way, the relative attenuation rate of incoming and outgoing light passing through the concentration field to be measured can be calculated. The relative attenuation rate can mostly reflect the relative

concentration of dust in the field to be measured. The intensity of light is positively correlated with the intensity of the electrical signal converted by photoelectricity. The relative attenuation rate can be obtained by measuring the electrical signal, and then the dust concentration in the field to be measured can be determined.
