LED grow lights is an artificial light source that uses LED (Light Emitting Diode) as the illuminant to meet the lighting conditions required for plant photosynthesis. In the absence of daylight, this light fixture can act as daylight, allowing plants to grow normally or better.

With the impact of global climate change and urbanization on traditional agriculture, the demand and energy consumption of plant lighting continue to expand. At the same time, with the maturity and popularization of LED lighting technology, LED lighting has also begun to be used in the agricultural field, becoming an advantage for the LED industry base market. At present, there are four main types of plant lighting sources on the market: LED lamps, fluorescent lamps, high-pressure sodium lamps, incandescent lamps and halogen lamps. Compared with traditional plant lighting fixtures, in addition to energy saving and environmental protection, LED plant lighting fixtures also have the advantages of freely combining spectra, high color purity, and rich colors. As LED plant lighting technology continues to improve, its application areas will become more and more extensive, including the top floors of skyscrapers, vertical farms, greenhouses, homes, shopping malls, and even abandoned containers, etc., where plant lighting can be developed.
