The global Inductive Proximity Sensors market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An inductive proximity sensor is a sensing device that detects metal targets using electromagnetic energy and without contact. The sensing range of an inductive proximity sensor changes based on the type of metal being detected. Since non-metallic substances such as dirt and liquid do not interfere with detection, an inductive proximity sensor operates in wet or dirty conditions.
