An induction motor is a motor that combines an induction motor and a reducer. It works on the principle of electromagnetic induction and is suitable for applications that require reducing speed and increasing torque. An induction motor generates a rotating magnetic field between the stator and the rotor through electromagnetic induction, which in turn drives the rotor to rotate. On this basis, the induction motor is also equipped with a reducer, which can effectively reduce the speed of the motor and increase the output torque, thereby increasing the load capacity. It is widely used in automation equipment, conveyor belts, cranes, robots and other occasions that require low speed and high torque output.

United States market for Induction Gear Motor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Induction Gear Motor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
