Induction heat treatment service is a process used to harden, soften, or modify the properties of metals and alloys. It involves heating metal parts using electromagnetic induction, which generates heat within the material itself. This localized heating allows for precise control over the heating process, resulting in uniform heat distribution and minimized distortion of the workpiece. Induction heat treatment offers several advantages over traditional methods such as flame heating or furnace heating, including faster heating rates, precise temperature control, and localized heating, which can reduce energy consumption and minimize distortion of the parts.

The global Induction Heat Treatment Service market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
