An inductive coupler device is a component used to transfer electrical energy or signals through inductive coupling. It typically consists of two coils, a transmitter and a receiver, which are placed in close proximity to each other without direct electrical contact. When an alternating current flows through the transmitter coil, it generates a magnetic field, which induces a current in the receiver coil, thereby transferring energy or data.

The global Inductive Coupler Device market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
