The inductance frequency modulated static level is an instrument used to measure the elevation difference of the earth's surface. It is based on the principle of inductance and determines the height difference between different measuring points by measuring changes in the ground's gravitational acceleration. This kind of instrument is usually used in civil engineering, building construction, geological exploration and other fields to ensure that the height difference between measurement points is within the specified accuracy range.

Inductive frequency modulated static levels have wide application prospects in civil

engineering, construction, geological exploration and other fields. As infrastructure construction and land development increase, so does the need for high-precision elevation measurements. Therefore, this market is expected to continue to grow, especially in areas with increasing urbanization and infrastructure development.
