The global Industrial Gamma Irradiation Devices market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Industrial gamma irradiation device is an irradiation device that uses cobalt source to generate gamma rays. The gamma irradiation device is equipped with an irradiation chamber and a conveyor system for transporting food in and out of the irradiation chamber. A concrete protective wall (generally 1.5 to 1.8 meters thick) is built around the irradiation chamber to prevent the leakage of ionizing radiation. Gamma irradiation devices can be used in the food and medical fields. They have strong ray penetration capabilities and can kill microorganisms carried in the contents through packaging. They can also be used in the agricultural field to perform radiation mutagenesis on seeds. The technical barriers to gamma irradiation equipment are high, and the number of companies capable of mass production is small.

United States market for Industrial Gamma Irradiation Devices is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
