The report requires updating with new data and is sent in 48 hours after order is placed.

An inertial navigation system (INS) is a navigation aid that uses a computer, motion sensors (accelerometers), rotation sensors (gyroscopes), and occasionally magnetic sensors (magnetometers) to continuously calculate by dead reckoning the position, the orientation, and the velocity (direction and speed of movement) of a moving object without the need for external references.

The advancement of global lifestyle has resulted in the need for equipment with greater ease of use. This has enabled the use of motion sensing technology which uses inertial sensors extensively. This is a key driving factor to this market and will play an important role in defining the market for the next few years.
