Lecithin is a natural constituent of all living cells with essential functions for humans, animals and plants. The term “Lecithin” describes the complex mixture of phospholipids and other natural occurring concomitant components like triglycerides, fatty acids, sterols and glycolipids. For industrial production of natural lecithins today vegetable oils and egg are the most important sources available, in particular soybean, rapeseed and sunflower.

The different types of lecithin are characterized by the content of polar lipids (Acetone Insolubles not less than 50%) and their phospholipid composition which determines the functionality of lecithin in the different applications.
