Mechanical pressure switch is a common pressure sensor, usually used to detect changes in pressure and convert the signal into a mechanical or electrical signal. Its working principle is based on the mechanical structure. Through the deformation of the mechanical structure under the action of pressure, it realizes the detection and conversion of pressure signals. Mechanical pressure switches usually consist of a spring, piston and switch. When external pressure acts on the piston, the piston will experience a force causing it to move downward. The spring is connected to the piston. When the force on the piston exceeds the elastic limit of the spring, the spring will be squeezed, causing the switch to operate. This action can be used to control the opening and closing of a certain mechanical device to detect and control pressure.

The global Industrial Machinery Pressure Switch market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
