A media converter, in the context of network hardware, is a cost-effective and flexible device intended to implement and optimize fiber links in every kind of network. Among media converters, the most often used type is a device that works as a transceiver, which converts the electrical signal utilized in copper unshielded twisted pair (UTP) network cabling to light waves used for fiber optic cabling. It is essential to have the fiber optic connectivity if the distance between two network devices is greater than the copper cabling's transmission distance.

A media converter offers fiber-to-fiber conversion as well, from multi-mode fiber into single-mode fiber. It also converts a dual fiber link to single fiber with the help of bi-directional (BIDI) data flow. In addition, media converters have the capability to convert between wavelengths for applications that use wavelength division multiplexing (WDM). Generally, media converters are protocol specific and they support an extensive array of data rates and network types. They are presented as physical layer or Layer 2 switching systems. Media converters that include Layer 2 switching functionality offer rate-switching as well as other innovative features.
