Metalens is a lens developed based on metasurface technology and using micro-nano technology and dielectric materials. Metalenses will completely subvert the cumbersome lens groups in traditional optical devices, realize the original lens functions of several millimeters or even centimeters with a thickness of microns, and integrate the functions of multiple optical elements into one, greatly reducing the size and weight of the imaging system, simplifying the structure and optimizing performance. The application of Metalens in industry has shown great potential. Its ultra-high resolution, thin and light design, and multifunctional integration enable it to significantly improve the performance and accuracy of microscopy, lithography, non-destructive testing, biomedical imaging, environmental monitoring, and safety monitoring. With the development of technology and the improvement of manufacturing processes, Metalens is expected to become an important and indispensable component in industrial equipment in the future, improving the efficiency and quality of industrial production and testing.

The global Industrial Metalens market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
