An industrial PC is a computer intended for industrial purposes (production of goods and services), with a form factor between a nettop and a server rack. Industrial PCs have higher dependability and precision standards, and are generally more expensive than consumer electronics. They often use complex instruction sets, such as x86, where reduced instruction sets such as ARM would otherwise be used.

Initially, industrial computers were only used for measurement, control, and management of industrial production processes. For example, production line control, robot control, and intelligent monitoring. Due to their high reliability and real-time requirements, industrial computers play an indispensable role in industrial scenarios. They can process and analyze sensor data and drive actuators to achieve automated operations. With the advancement of technology, industrial computers can assume greater responsibilities and their roles become more important. At present, industrial computers have been widely used in the fields of intelligent transportation, medical instruments, self-service terminals, military equipment, and are constantly expanding to financial services, network security, multimedia applications, and other fields. In the future, the industrial computer architecture will be more interactive and operational, and will integrate multiple information systems into an open and standardized platform.

The global Industrial PCs for Industrial Automation market size is projected to grow from US\$ 2221 million in 2024 to US\$ 2885 million in 2030; it is expected to grow at a CAGR of 4.5% from 2024 to 2030.
