Abstracts

The global Industrial Pipeline Lining Materials market size is predicted to grow from US$ 9293 million in 2025 to US$ 13150 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

Industrial pipeline lining materials are used to protect the inner walls of pipelines, preventing corrosion, wear, and chemical reactions. These materials are typically applied in various industries such as oil and gas, power generation, chemicals, drinking water, and wastewater treatment. They form a strong protective layer by coating or lining the interior of the pipeline, which not only extends the lifespan of the pipeline but also enhances the safety of the transported media.

With the ongoing global industrialization process, pipeline systems play a critical role across industries. Particularly in the energy sector, such as oil and gas, pipeline transportation systems are tasked with transporting large volumes of resources, making the need for pipeline protection increasingly urgent. As a key component in improving pipeline durability and corrosion resistance, lining materials have become an essential part of the industry.

Currently, common industrial pipeline lining materials include epoxy resin, polyethylene (PE), polyurethane (PU), polyvinyl chloride (PVC), and rubber. These materials can be chosen based on specific operating environments and requirements. For example, epoxy resin is widely used in oil and gas pipelines due to its excellent corrosion resistance and high-temperature durability, while polyvinyl chloride lining is more cost-effective and offers good corrosion resistance in wastewater pipelines.
