The global Inert Gas Nebulizer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An inert gas nebulizer is a device that is used to generate a fine mist or aerosol of liquid by using a stream of inert gas, such as nitrogen or argon. The liquid is typically a solution or suspension of a drug, which can be inhaled by the patient to achieve therapeutic effects.

The nebulizer works by using a high-pressure gas to create a low-pressure area that draws the liquid into the nebulizer. The gas and liquid then mix and exit the device as a fine mist or aerosol, which can be inhaled by the patient through a mouthpiece or mask.

Inert gas nebulizers are commonly used in the treatment of respiratory diseases, such as asthma, chronic obstructive pulmonary disease (COPD), and cystic fibrosis. They are also used to deliver medication to patients who have difficulty using other forms of inhalation therapy, such as metered-dose inhalers or dry powder inhalers.

United States market for Inert Gas Nebulizer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
