An Inert Gas Fusion Analyzer is an instrument used for elemental analysis, particularly for the determination of trace elements in materials, such as non-metallic elements such as hydrogen, oxygen, and nitrogen, as well as certain metallic elements. This analyzer utilizes a high temperature inert gas atmosphere (usually argon) to melt the sample, thereby converting the target elements in the sample into a gaseous form that is released and subsequently detected and quantitatively analyzed by a mass spectrometer (MS) or other detector. This technique has a wide range of applications in metallurgy, petrochemistry, and materials science because it is fast, efficient, and avoids sample contamination.

The global Inert Gas Fusion Analyzer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
