Inferior vena cava filter - Gunther Tulip.[1]

An inferior vena cava filter (IVC filter) is a type of vascular filter, a medical device that is implanted by interventional radiologists or vascular surgeons into the inferior vena cava to presumably prevent life-threatening pulmonary emboli (PEs).

Their effectiveness and safety profile is not well established, and in general, they are only recommended in some high-risk scenarios.

They are not intended to be a replacement for medical (drug-based) management of venous thromboembolism (VTE). However, in cases where patients are at high risk of developing a clinically significant PE and cannot be sufficiently anticoagulated, placement of an IVC filter may be recommended.

Over the next five years, LPI(LP Information) projects that Inferior Vena Cava (IVC) Filter will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Inferior Vena Cava (IVC) Filter market for 2018-2023.
