Seatbelts are the primary restraint system used in the automotive industry. Higher safety demands and evolution of technology have led to the development of inflatable seatbelts. The inflatable seatbelts have a tubular airbag across its length that inflates to protect the occupants during a crash. The tubular airbag on the belts is filled with compressed gas through a cylinder placed below the seat, unlike the conventional airbag that inflates through rapid chemical reaction. The inflatable seatbelt contains a control unit that signals the inflator to inflate the bag during a collision.
